

Welcome Back

We will get started shortly...

Q: Have you submitted your authorized support users to customer.success@HashiCorp.com

Importing Resources & Migrating State into Terraform Enterprise

February 2023

Terraform Enterprise Path to Production

Agenda

1. Terraform Basics
2. Importing Existing Infrastructure
3. Migrating from OSS to Enterprise

Terraform Basics

The background of the slide is a dark purple. In the top right corner, there are decorative geometric patterns. These include a grid of small white dots in the upper right, and a series of parallel white diagonal lines in the lower right, all set against a slightly lighter purple background.

Infrastructure as Code

Using HashiCorp Configuration Language (HCL) infrastructure and services from any provider can be provisioned in a codified, secure, and automated fashion

- HCL is human readable and machine executable
- HCL is a declarative, Turing-Complete language
- Used to automate, version, and collaborate on infrastructure

```
CODE EDITOR

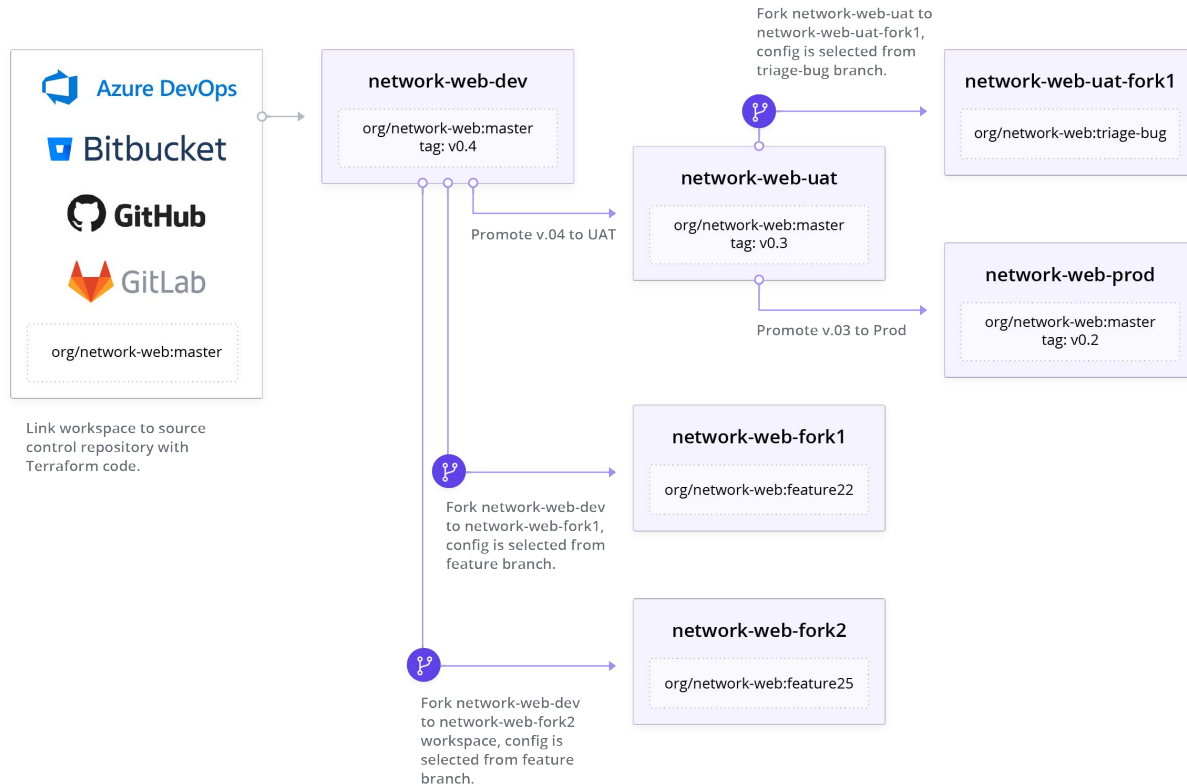

resource "google_compute_instance" "svr" {
  name         = "server"
  machine_type = "g1-small"
  zone         = "us-central1-a"
  disk {
    image = "ubuntu-1404-trusty-v20160114e"
  }
}

resource "dnsimple_zone_record" "hello" {
  zone_name = "example.com"
  name      = "server"
  value     =
google_compute_instance.svr.network_interface.0.
address
  type      = "A"
}
```

Benefits of Infrastructure as Code

- Versioning
- Collaboration
- Promotion
- Forking

Ways to interact with Terraform

CLI

Terraform CLI

- No requirements for collaboration
- No requirements for centralized reusable configs
- No policy or governance requirements

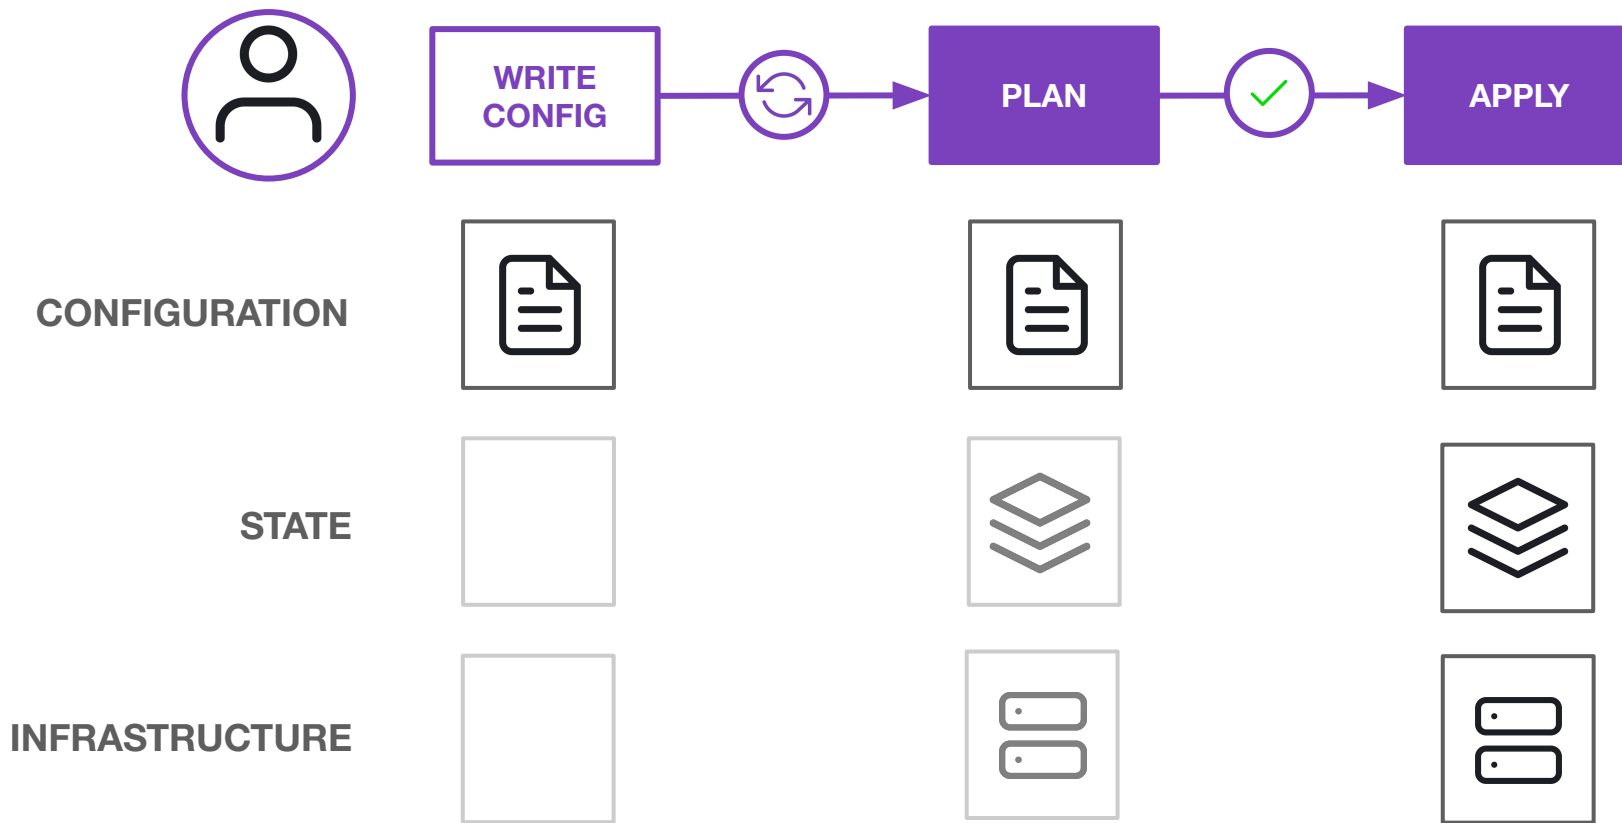

Enterprise / Cloud

Self-Hosted / SaaS

- Air gapped infrastructure and applications
- Data sovereignty requirements
- Regulatory compliance requirements
- Stringent reliability and availability requirements

Terraform Workflow

Terraform Core Engine

- The “engine” driving Terraform Enterprise
- Loads providers as needed
- OSS [hosted on Github](#)
- Responsible for:
 - Reading and Interpolating configuration files and modules
 - State Management
 - Executing plan
 - Communicating with providers
 - Constructing resource graphs

Resource Graph

- Safely provision and change infrastructure
- See planned infrastructure changes before execution
- No need to manually coordinate dependent resources

Provider Plugins

- Expose implementation for specific services
- Offer extensible layer for 'Core' to learn how to talk to anything with an API without any upgrades
- Responsible for:
 - Initializing libraries for API calls
 - Authenticating with the provider
 - Defining resources that map to services
 - Executing commands or scripts for designated resources

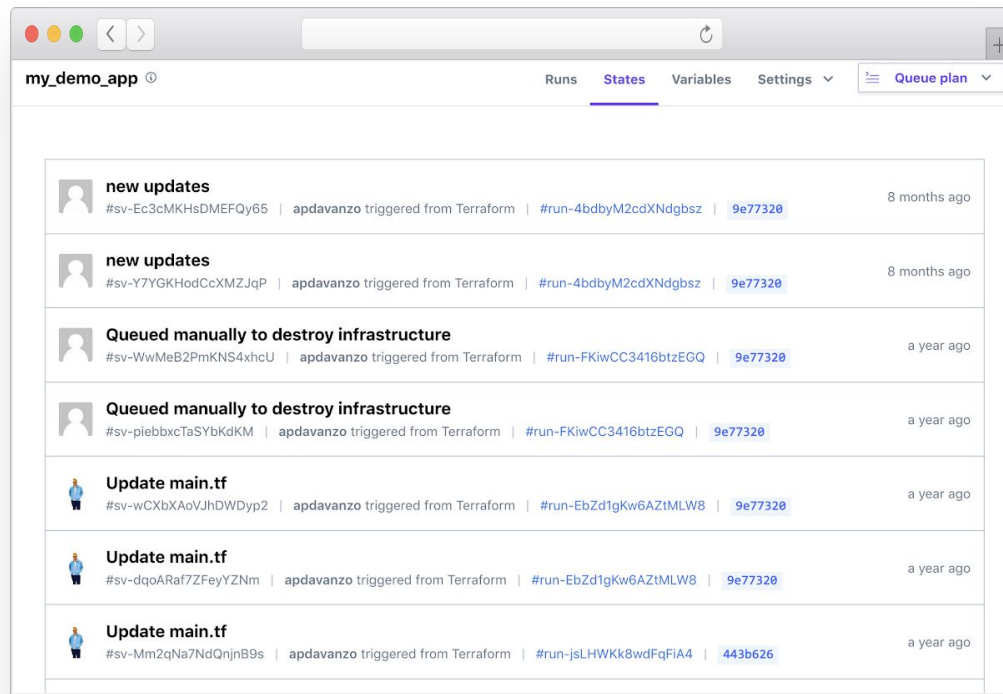

Infrastructure State

State is Terraform's understanding of an infrastructure

- Used by Terraform to provide an understanding of resources under its control
- TFE can use it to show where previous runs have made changes to infrastructure
- TFE provides remote state management which encrypts the state file

Managing existing infrastructure with TFE

Import Unmanaged Cloud Resources

Terraform Import

- Terraform is able to import existing infrastructure
- Importing takes resources created by some other method and bring it under Terraform management
- This is a great way to slowly transition infrastructure to Terraform

Terraform Import Workflow

Importing Prerequisites

Before you can import existing infrastructure into Terraform Enterprise you must have completed the following:

- Installed [Terraform CLI](#) locally
- Deployed Terraform Enterprise
- [Tutorial](#)

Steps

1. Write Terraform code that matches your infrastructure
2. Import infrastructure into your Terraform state file using **terraform import**
3. Review plan output from **terraform plan** to ensure the configuration matches expected state
4. Apply the configuration to update your Terraform state by running **terraform apply**

Step 1

Write Terraform code that matches your infrastructure.

```
[main.tf]
```

```
provider "aws" {  
    region = "eu-west-1"  
}  
  
resource "aws_vpc" "testvpc" {  
    cidr_block = "10.0.0.0/16"  
}  
  
output "vpcid" {  
    value = aws_vpc.testvpc.id  
}
```

TERMINAL

Step 2

Initialize Terraform with
`terraform init`

```
$ terraform init
```

```
Initializing the backend...
```

```
Initializing provider plugins...
```

- Finding latest version of hashicorp/aws...
- Installing hashicorp/aws v3.68.0...
- Installed hashicorp/aws v3.68.0 (signed by HashiCorp)

```
Terraform has created a lock file .terraform.lock.hcl to record the provider selections it made above. Include this file in your version control repository so that Terraform can guarantee to make the same selections by default when you run "terraform init" in the future.
```

```
Terraform has been successfully initialized!
```

```
You may now begin working with Terraform. Try running "terraform plan" to see any changes that are required for your infrastructure. All Terraform commands should now work.
```

```
If you ever set or change modules or backend configuration for Terraform, rerun this command to reinitialize your working directory. If you forget, other commands will detect it and remind you to do so if necessary.
```

Step 3

Import infrastructure into
your Terraform state file
using `terraform import`

```
$ terraform import aws_vpc.testvpc "vpc-aabbccdd"
```

```
aws_vpc.testvpc: Importing from ID "vpc-aabbccdd"...
```

```
aws_vpc.testvpc: Import prepared!
```

```
Prepared aws_vpc for import
```

```
aws_vpc.testvpc: Refreshing state... [id=vpc-aabbccdd]
```

```
Import successful!
```

```
The resources that were imported are shown above. These resources are now in  
your Terraform state and will henceforth be managed by Terraform.
```

Step 4

Review the plan output from `terraform plan` to ensure the configuration matches expected state

```
$ terraform plan
```

```
aws_vpc.testvpc: Refreshing state... [id=vpc-aabbccdd]
```

```
Changes to Outputs:  
+ vpcid = "vpc-aabbccdd"
```

```
You can apply this plan to save these new output values to the Terraform state,  
without changing any real infrastructure.
```

```
Note: You didn't use the -out option to save this plan, so Terraform can't  
guarantee to take exactly these actions if you run "terraform apply" now.
```

Step 5

Apply the configuration to
update your Terraform state
by running
`terraform apply`

```
$ terraform apply
```

```
aws_vpc.testvpc: Refreshing state... [id=vpc-aabbccdd]
```

```
Changes to Outputs:  
+ vpcid = "vpc-aabbccdd"
```

```
You can apply this plan to save these new output values to the Terraform state,  
without changing any real infrastructure.
```

```
Apply complete! Resources: 0 added, 0 changed, 0 destroyed.
```

```
Outputs:
```

```
vpcid = "vpc-aabbccdd"
```

Migrating Existing State

Prerequisites

Before you can migrate Terraform OSS state into Terraform Enterprise you must have completed the following:

- Installed [Terraform CLI](#) locally
- Deployed Terraform Enterprise
- Optionally: Acquired an API token for Terraform Enterprise

Migration Steps

Before:

- Take a backup!
- Ensure that you have initialized your existing state
- Create and configure the Workspace in Terraform Enterprise

During:

- Login to Terraform Enterprise and generate an API Token
- Add the Terraform remote backend
- Reinitialize Terraform and confirm state migration

After:

- Verify that the state has been migrated to the workspace
- Move old state (to another backup)
- Trigger a remote run within Terraform Enterprise
- Check everything worked as expected

Before

Review the existing
Terraform code

```
[main.tf]

terraform {
  required_providers {
    aws = {
      source = "hashicorp/aws"
      version = ">= 3.68.0"
    }
  }
  required_version = ">= 1.0.7"
}

provider "aws" {
  region = "eu-west-1"
}

resource "aws_vpc" "testvpc" {
  cidr_block = "10.0.0.0/16"
}

output "vpcid" {
  value = aws_vpc.testvpc.id
}
```

CODE EDITOR

Create and configure the workspace to include AWS credentials

PyroCumulus

Terraform version1.0.11

Updateda few seconds ago

Overview

Runs

States

Variables

Settings

Unlocked

Actions

Variables

Terraform uses all [Terraform](#) and [Environment](#) variables for all plans and applies in this workspace. Workspaces using Terraform 0.10.0 or later can also load default values from any `*.auto.tfvars` files in the configuration. You may want to use the Terraform Cloud Provider or the variables API to add multiple variables at once.

Sensitive variables

[Sensitive](#) variables are never shown in the UI or API, and can't be edited. They may appear in Terraform logs if your configuration is designed to output them. To change a sensitive variable, delete and replace it.

Workspace variables (0)

Variables defined within a workspace always overwrite variables from variable sets that have the same type and the same key. Learn more about variable set [precedence](#).

Key	Value	Category
<div><div>Select variable category</div><div><div><input type="radio"/> Terraform variable</div><div>These variables should match the declarations in your configuration. Click the HCL box to use interpolation or set a non-string value.</div></div><div><div><input checked="" type="radio"/> Environment variable</div><div>These variables are available in the Terraform runtime environment.</div></div></div>		
<div>Key</div> <div>AWS_ACCESS_KEY_ID</div>	<div>Value</div> <div>ASIAQI5S3I4IY34O3J3Z</div>	<div><input type="checkbox"/> Sensitive</div>
<div><div>Variable Description</div><div>description (optional)</div></div>		
<div><div>Save variable</div><div>Cancel</div></div>		

Step 1

Login to Terraform
Enterprise and generate
an API Token

```
$ terraform login
```

```
Terraform will request an API token for tfe.mycompany.com using your browser.
```

```
If login is successful, Terraform will store the token in plain text in  
the following file for use by subsequent commands:
```

```
/home/demouser/.terraform.d/credentials.tfrc.json
```

```
Do you want to proceed?
```

```
Only 'yes' will be accepted to confirm.
```

```
Enter a value: yes
```

```
-----  
Terraform must now open a web browser to the tokens page for tfe.mycompany.com.
```

```
If a browser does not open this automatically, open the following URL to proceed:  
https://tfe.mycompany.com/app/settings/tokens?source=terraform-login
```

```
-----  
Generate a token using your browser, and copy-paste it into this prompt.
```

```
Terraform will store the token in plain text in the following file  
for use by subsequent commands:
```

```
/home/demouser/.terraform.d/credentials.tfrc.json
```

```
Token for tfe.mycompany.com:
```

```
Enter a value:
```

```
Retrieved token for user demouser
```

TERMINAL

Step 2

Add the Terraform
Remote Backend

```
[main.tf]

terraform {
  required_providers {
    aws = {
      source = "hashicorp/aws"
      version = ">= 3.68.0"
    }
  }
  required_version = ">= 1.0.7"
  cloud {
    organization = "<ORG_NAME>"
    workspaces {
      name = "Example-Workspace"
    }
  }
}
...
```

TERMINAL

Step 3

Reinitialize Terraform and
confirm state migration

```
$ terraform init
```

```
Initializing Terraform Cloud...
```

```
Do you wish to proceed?
```

```
As part of migrating to Terraform Cloud, Terraform can optionally copy your  
current workspace state to the configured Terraform Cloud workspace.
```

```
Answer "yes" to copy the latest state snapshot to the configured  
Terraform Cloud workspace.
```

```
Answer "no" to ignore the existing state and just activate the configured  
Terraform Cloud workspace with its existing state, if any.
```

```
Should Terraform migrate your existing state?
```

```
Enter a value:
```

TERMINAL

After

Verify the workspace exists and that the state file has been uploaded

17      "provider": "provider[\\\"registry.terraform.io/hashicorp/aws\\\"]",
```

Trigger a remote run within Terraform Enterprise

TERMINAL

```
$ mv terraform.tfstate terraform.tfstate.local
```

```
$ terraform apply
```

Running apply in the remote backend. Output will stream here. Pressing Ctrl-C will cancel the remote apply if it's still pending. If the apply started it will stop streaming the logs, but will not stop the apply running remotely.

Preparing the remote apply...

To view this run in a browser, visit:

<https://tfe.mycompany.com/app/myorganization/state-migration/runs/run-64iLttGfK5eSLJ3F>

Waiting for the plan to start...

Terraform v1.0.11

on linux_amd64

Configuring remote state backend...

Initializing Terraform configuration...

aws_vpc.testvpc: Refreshing state... [id=vpc-01feeac01bbb6af51]

Note: Objects have changed outside of Terraform

Terraform detected the following changes made outside of Terraform since the last "terraform apply":

```
# aws_vpc.testvpc has been changed
~ resource "aws_vpc" "testvpc" {
  id              = "vpc-01feeac01bbb6af51"
  + tags          = {}
  # (15 unchanged attributes hidden)
}
```

Unless you have made equivalent changes to your configuration, or ignored the relevant attributes using ignore_changes, the following plan may include actions to undo or respond to these changes.

No changes. Your infrastructure matches the configuration.

Verify a remote run has
been triggered by the CLI

Step-by-step guides to accelerate deployment of Terraform Enterprise

A screenshot of a web browser displaying the Terraform Developer website. The browser window has a macOS-style title bar with red, yellow, and green window control buttons. The website's navigation bar is dark with the Terraform logo and links for Home, Documentation, Tutorials, Install, Registry, and Try Cloud. A search bar is on the right. The left sidebar contains a list of navigation items: Terraform Home, Tutorials, Overview, Get Started, AWS, Azure, Docker, GCP, OCI, Terraform Cloud (highlighted), Fundamentals, CLI, Configuration Language, and Modules. The main content area shows the breadcrumb 'Developer / Terraform / Tutorials / Terraform Cloud' and the title 'Get Started - Terraform Cloud'. Below the title is a paragraph about collaborating on version-controlled configuration using Terraform Cloud, followed by a link to 'Create an account'. A 'Start' button and a box indicating '10 tutorials' are present. The first tutorial card is titled 'What is Terraform Cloud - Intro and Sign Up', estimated to take 5 minutes, and describes signing up for Terraform Cloud's features. The second tutorial card is partially visible, titled 'Log in to Terraform Cloud from the CLI', estimated to take 3 minutes.
